

K-Mouse Turbo 2017-LP

PCB Case Assembly Manual

Introduction

Thanks for buying this PCB case upgrade kit for your K-Mouse Turbo 2017 LP interface!
This will complete your interface with a professional looking case.

'PCB' stands for Printed Circuit Board, what the case material is made of.

The screws are made of plastic, to avoid scratches.

The light guide, spacers and button cap adapter, are all 3D printed.

In the box

Step 1

Place the self-adhering rubber feet at the 'FOOT' spot on the bottom board.

Step 2

Add the three 10mm plastic screws.

Step 3

Carefully rotate the bottom board, and add the spacers like shown here. The 'flat side' of the large spacer should be on the inside.

Step 4

Now place your K-Mouse 2017-LP or K-Mouse 2017-LP XL interface on top, with the left hole exactly on the screw, and the right side on the support of the right spacer.

Step 5

Attach the three threaded 10mm spacers to the screws.

Also add the reset button cap with adapter, on top of the tactile button.

Step 6

Attach the light guide to the bottom of the top board, as shown. Mind the orientation!

You can add some super glue, but it's usually not required.

Step 7

Add the top board to the bottom parts.

Final step

Add the three 4mm screws to the top board (easiest by hand), and fasten them with a screwdriver.
